0. Introduction

0.2 Engineering formulae for motor drives

Power (3-phase motors)

$$P_1 = \text{power input} = \frac{U \cdot I \cdot \cos \varphi \cdot \sqrt{3} \cdot 10^{-3}}{1} \text{ [kW]}$$
$$P_2 = \text{power output} = P_1 \cdot \eta \text{ [kW]}$$

Where:

$$U = \text{voltage [V]}$$
$$I = \text{current [A]}$$
$$\cos \varphi = \text{power factor}$$
$$\eta = \text{efficiency}$$

Power requirements of some applications

Lifting:

$$P = \frac{m \cdot v}{\eta} \cdot 9.81 \cdot 10^{-3} \text{ [kW]}$$

Rotation:

$$P = \frac{M \cdot n}{9550 \cdot \eta} \text{ [kW]}$$

Fan and pump drives:

$$P = \frac{H \cdot Q}{\eta} \text{ [W]}$$

Where:

$$P = \text{power [kW]}$$
$$m = \text{mass [kg]}$$
$$v = \text{speed [m/s]}$$
$$n = \text{rotational speed [min}^{-1}\text{]}$$
$$\eta = \text{efficiency}$$
$$M = \text{torque [Nm]}$$
$$Q = \text{output [m}^3\text{/s]}$$
$$H = \text{head [N/m}^2\text{]}$$

Torque from motor power

$$M = 9550 \cdot \frac{P_2}{n} \text{ [Nm]}$$

Where:

$$P_2 = \text{motor output [kW]}$$
$$n = \text{motor speed}$$

Conversion of torque for step-up and step-down speed ratios:

$$M_2 = \frac{M_1 \cdot n_1}{n_2}$$

Where:

$$n_1 = \text{motor speed [min}^{-1}\text{]}$$
$$M_1 = \text{motor torque at } n_1 \text{ [Nm]}$$
$$n_2 = \text{speed of load [min}^{-1}\text{]}$$
$$M_2 = \text{torque of load at } n_2 \text{ [Nm]}$$

Moment of Inertia J

Moment of Inertia of a cylindrical flywheel:

$$J = \frac{md^2}{8}$$

Where:

$$m = \text{mass [kg]}$$
$$d = \text{flywheel diameter [m]}$$

Effective moment of inertia on the motor of a linearly moved load:

$$J = 91.2 \cdot m \cdot \left(\frac{v}{n}\right)^2$$

Where:

$$m = \text{mass [kg]}$$
$$v = \text{velocity [m/s]}$$
$$n = \text{motor speed [min}^{-1}\text{]}$$

Conversions of moments of inertia for step-up or step-down speed ratio:

$$J_2 = J_1 \cdot \left(\frac{n_1}{n_2}\right)^2$$

Where:

$$n_1 = \text{motor speed}$$
$$J_1 = \text{moment of inertia at } n_1$$
$$n_2 = \text{speed of load}$$
$$J_2 = \text{moment of inertia of load}$$

Factor of Inertia FI

$$FI = \frac{J_{\text{mot}} + J_{\text{load}}}{J_{\text{mot}}}$$

Where:

$$J_{\text{mot}} = \text{moment of inertia of motor}$$
$$J_{\text{load}} = \text{moment of inertia of load}$$

Starting time t_a

$$t_a = \frac{FI \cdot J_{\text{mot}} \cdot n}{9.55 \cdot (M_{\text{mot}} - M_{\text{load}})} \text{ [s]}$$

Where:

$$FI = \text{Factor of inertia}$$
$$J_{\text{mot}} = \text{moment of inertia of motor [kgm}^2\text{]}$$
$$n = \text{motor speed [min}^{-1}\text{]}$$
$$M_{\text{mot}} = \text{motor torque during starting (mean) [Nm]}$$
$$M_{\text{load}} = \text{counter torque of load during starting (mean) [Nm]}$$

Speed

The no-load speed is virtually the same as the synchronous speed. The synchronous speed of the motor is calculated as follow:

$$n_s = 120 \cdot f/p \text{ [min}^{-1}\text{]}$$

Where:

$$f = \text{frequency [Hz]}$$
$$p = \text{number of pole}$$

The synchronous speed is reduced by the slip (S) to the rated speed:

$$n_n = n_s \cdot (1-S) \text{ [min}^{-1}\text{]}$$

0. Introduction

0.3 Standards and specifications

Flameproof motors conform to the following standards and specifications:

0. Introduction

0.4 Protection against explosions in dangerous areas

0.4.1 Types protection

The use of an electrical apparatus in potentially explosive atmospheres is quite usual today.

This equipment has to be manufactured in such a way that there is no risk of explosion.

An explosion occurs when of the three following conditions happen:

- presence of a potentially explosive atmosphere;
- possibility of transmission of the explosion;
- existence of an ignition source.

The recognized types of protection eliminate one of these conditions and thus make an explosion impossible.

Fig. 0A - Specific marking for protection against explosions - Directive 94/9/EC.

Protection methods for GAS

Two types of protection prevent the presence of a potentially explosive atmosphere inside the electrical apparatus:

- oil immersion (safety “o”);
- pressurized apparatus (safety “p”).

Two types of protection make the transmission of an internal explosion to the potentially explosive atmosphere surrounding the electrical apparatus impossible:

- sand filling (safety “q”);
- flameproof enclosure (safety “d”).

Lastly, three types of protection eliminate any source of ignition, such as sparks, overheating, etc...:

- increased safety (safety “e”);
- intrinsic safety (safety “i”);
- protection “n” (restricted to zone 2).

Protection method for flammable dusts

For flammable dusts, only one method of protection is provided for:

- housing which prevents the infiltration of dust and surface temperature limitation (protection type “t”).

In practice only five of these eight methods of protection are applicable to the electric motor:

- pressurized apparatus (symbol Ex p);
- flameproof enclosure (symbol Ex d);
- increased safety (symbol Ex e);
- non sparking protection (symbol Ex n);
- protection by a housing (symbol Ex t).

Electric motors have another method of protection for gas (symbol Ex de) which is a combination of:

- flameproof enclosure “d” for motor frame;
- increased safety “e” for terminal box.

0.4.2 Dangerous areas and zones

Dangerous areas include any area in which explosive atmospheres may occur under specific conditions.

An explosive atmosphere is a mixture of air and combustible gases, vapours, fumes or dust under atmospheric conditions where combustion expands itself (explosion) after ignition.

Only local authorities can classify hazardous areas.

The users shall classify the hazardous areas as indicated in the European directive 1999/92/EC under their own responsibility.

International standards IEC 61241-10 provide instructions on how to classify the hazardous areas in relation to the chemical nature, to the physical characteristics and to the amount of substances used and based on the frequency and period of time in which an explosive mix may develop.

Fig. 0B - Warning sign for areas subject to the risk of explosion - Directive 99/92/EC

Zones susceptible to gas

When the hazard is due to the presence of gas, vapours or mists of flammable substances, the European directive 1999/92/EC envisages a classification in three zones defined as follows:

Zone 0 - Areas constantly susceptible to an explosive atmosphere, or for long periods of time. Power equipment with double insulation must be installed in this area.

Zone 1 - Areas where an explosive atmosphere is likely to develop during normal conditions. Flameproof electric motors or motors with added protection means can be installed in this zone (for the latter, restrictions by the standards apply).

Zone 2 - Areas rarely susceptible to an explosive atmosphere and for a short period of time.

Flameproof motors or motors with added protection can be installed in this zone, as well as non-sparking motors.

Zones susceptible to combustible dust

When the hazard is due to the presence of combustible dust, the European directive 1999/92/EC envisages a classification in three zones defined as follows:

Zone 20 - Areas constantly susceptible to an explosive atmosphere, or for long periods of time. Power apparatus cannot be installed in this zone.

Zone 21 - Areas where an explosive atmosphere is likely to develop during normal conditions. Electric motors certified in compliance with the ATEX directive with IP6x protection rating can be installed in this zone

Zone 22 - Areas rarely susceptible to an explosive atmosphere, and only for a short period of time. Depending on the type of dust also in zone 22 it may be necessary to have IP6x construction (see 0.4.4).

Table 0C - Dangerous areas classified into zones

Usage area in the presence of GAS	Usage area in the presence of COMBUSTIBLE DUSTS	Hazardous level of the operational ZONE
Zone 0	Zone 20	Explosive atmosphere ALWAYS PRESENT
Zone 1	Zone 21	PROBABLE explosive atmosphere
Zone 2	Zone 22	Explosive atmosphere UNLIKELY

0. Introduction

0.4.3 Apparatus classification

The ATEX 94/9/EC European Directive classifies equipment into three categories, with differing protection levels, related to the protection guaranteed.

NOTE: Equipment of higher categories can also be installed instead of those of a lower category.

Table 0D - Equipment categories

PROTECTION LEVEL guaranteed by the equipment Category	MINE	SURFACE	
	Category	GAS Category	COMBUSTIBLE DUST Category
Very high	M1	1G	1D
High	M2	2G	2D
Normal	not provided for	3G	3D

0.4.4 Enclosure groups

The standards classify electrical equipment into two groups.

Group I: electric apparatus to be installed in mines or galleries susceptible to firedamp or coal dust.

Group II: electric apparatus to be installed in surface plants susceptible to other explosive atmospheres.

The housings for equipment to be used at the surface in the presence of gas, with protection method "d" (explosion proof), are in turn subdivided into three sub-groups depending on the flammable substances for which they are suitable:

Group IIA, Group IIB, Group IIC.

A motor that belongs to a certain enclosure group is also suitable for lower enclosure groups: a motor in group IIB is also suitable for group IIA; a motor in group IIC is also suitable for group IIA and IIB.

The housings for equipment to be used in atmospheres containing flammable dust, with protection method "t", are separated into three sub-groups depending on the type of dust:

IIIA: flammable particles
 IIIB: non-conducting dust
 IIIC: conducting dust

Note: for the IIIC group and also for installation in zone 22 a minimum protection level of IP6x is necessary.

0.4.5 Temperature classes (for gas atmospheres)

The electrical apparatus is classified into 6 classes according to the maximum surface temperatures.

The maximum surface temperature is the highest temperature which is attained in service under the conditions described in the standards, by any part of the electrical apparatus, which, could ignite the surrounding atmosphere.

For electric motors this is:

- the temperature of the outside surface of the enclosure for "d" and "p" protection modes;
- the temperature of any internal or external point for type of protection "e" or "n".

Table 0E

Ignition temperature of medium relative to limit temperature [°C]	Temperature class	Maximum surface temperature of electrical equipment including 40°C ambient temperature	
		[°C]	[°F]
over 450	T 1	450	842
from 300 to 450	T 2	300	572
from 200 to 300	T 3	200	392
from 135 to 200	T 4	135	275
from 100 to 135	T 5	100	212
from 85 to 100	T 6	85	185

0. Introduction

0.4.6 Combustion temperatures of gases, vapours and groups

Combustible gases and vapours are divided into classes according to their ignition temperature and into groups according to their explosive capacity.

Markings on motors and other electrical equipment with the symbols used to indicate the protection mode, the enclosure group, and the temperature class, indicate the zone in which such equipment can be installed.

The indications contained in table 0F are shown only as an example.

Classification of the substances is not the responsibility of the supplier of the equipment.

Responsibility for the choice of equipment lies with the user.

Table 0F - Classification of the more common combustible gases and vapours according to temperature class and group

Group	Temperature classes					
	T 1	T 2	T 3	T 4	T 5	T 6
I	Methane (firedamp)					
IIA	Acetic acid Acetone Ammonia Benzole Benzene Carbonone Carbon monoxide Ethane Ethyl acetate Ethyl Chloride Methane Methanol Methyl acetate Methyl alcohol Methyl Chloride Naphtalene Propane Toluene Xylene	Acetic anhydride l amyl acetate n butane n butyl alcohol Amylic alcohol Butyl acetate Cyclohexanon Ethyl alcohol Iso butylic alcohol Liquefied gas Natural gas Propyl acetate	Cyclohexane Cyclohexanol Decane Diesel fuels Gasoline Heating oil Heptane Hexane Jet fuels Pentane Petroleum*	Acetaldehyde Ether		
IIB	Coke-oven gas Water gas (carburetted)	1,3- butadiene Ethylene Ethylbenzene Ethylene oxide	Hydrogen sulphide Isoprene Petroleum*	Ethyl ether		
IIC	Hydrogen	Acetylene				Carbon disulphide Ethyl nitrate

*depending on composition

0. Introduction

0.4.7 Temperature for atmospheres with combustible dusts

The flash point of the dust must be taken into account in providing protection against flammable dust, in both the cloud form and in layers.

The surface temperature of the enclosure indicated on the motor nameplate must be less than the reference ignition temperature. The reference temperature is the lowest between the two values thus calculated:

$TS1 = 2/3 T_{cl}$ (T_{cl} = ignition temperature of the cloud of dust)

$TS2 = T_{5mm} - 75K$ (T_{5mm} = ignition temperature of a 5mm layer of dust).

T_{amm} = lowest between $TS1$ and $TS2$.

Table 0G - Calculation of the flash points for combustible dusts

Dust ignition temperature	Cloud T_{cl}	Layer T_{5mm}
↓		
Safety temperature	$TS1 = 2/3 T_{cl}$	$TS2 = T_{5mm} - 75K$
↓		
Maximum surface temperature	$T_{amm} = \text{lowest between } TS1 \text{ and } TS2$	
↓		
Surface temperature of the motor $\leq T_{amm}$		

The surface temperature class is expressed as degrees Celsius, the manufacturer determines the temperature class depending on the thermal characteristics of its own product.

The temperature classes for the Cemp product are as follows:

$T150^{\circ}C$ - $T135^{\circ}C$ - $T125^{\circ}C$ - $T100^{\circ}C$ - $T85^{\circ}C$.

The indications contained in table 0H are given only by way of example.

Classification of the substances is not the responsibility of the supplier of the equipment.

Responsibility for the choice of equipment lies with the user.

Table 0H - Examples of flash points for combustible dusts

	Cloud [$^{\circ}C$]	Layer [$^{\circ}C$]
Aluminium	590	>450
Carbon dust	380	225
Flour	490	340
Wheat dust	510	300
Methylcellulose	420	320
Phenolic resin	530	>450
Polyethylene	420	melting
PVC	700	>450
Soot	810	570
Starch	460	435
Sugar	490	460

Source SIRA Ltd

0.4.8 Level of protection for the equipment (EPL, equipment protection level)

In accordance with standard IEC EN 60079-0 the marking of equipment to be used in a potentially explosive atmosphere must also have the suffix EPL.

EPL is defined as the level of protection assigned to electrical equipment based on the probability of it becoming a source of ignition.

The EPL also makes it possible to distinguish between the different explosive atmospheres.

The first letter makes the following distinctions:

M - for mining

G - for gas

D - for dust

The second letter gives information on the probability of becoming a source of ignition:

a - "very high" protection level (guarantees safety in normal operation, during foreseeable malfunctions and when subject to rare cases of malfunction);

b - "high" protection level (guarantees safety in normal operation and when subject to foreseeable malfunctions);

c - "increased" protection level (it is not a source of ignition during normal operation and has some additional protection measures to ensure that it remains an inactive source of ignition in events occurring regularly).

0. Introduction

0.4.9 Choice of safety-electric motor

The connection between danger zones and the categories of equipment to be used is defined in Directive 1999/92/EC.

The specific construction standards for the protection modes (e.g. Ex d) also define the motor category that can be obtained by applying the standards (e.g. 2G).

Table 0I - Choosing the protection mode for zones in which gas is present

Explosive Atmosphere	Danger Zone	Protection guaranteed by Equipment	Motor Category	Protection Mode
ALWAYS PRESENT	0	Very High	1G	IEC EN 60079-26
PROBABLE	1	High	2G	Ex d Ex de Ex e
IMPROBABLE	2	Normal	3G	Ex nA

Table 0L - Choice of protection mode for areas where combustible dust is present

Explosive Atmosphere	Danger Zone	Protection guaranteed by Equipment	Motor Category	Protection Mode
ALWAYS PRESENT	20	Very High	1D	Ex ta
PROBABLE	21	High	2D	Ex tb - IP6x
IMPROBABLE	22 Conductive dusts	Normal	2D	Ex tb - IP6x
IMPROBABLE	22 Non-conductive dusts	Normal	3D	Ex tc - IP5x

N. B. Equipment of a higher category can be installed in place of equipment of a lower category.

1. General informations

1.1 Range of motors

The motors presented in this catalogue respect the standards in relation to equipment and protection systems for use on safe areas or potentially explosive atmospheres, in conformity with European directive n. 94/9/CE del 23/3/94, known as the ATEX directive.

Classification of the areas is the responsibility of the user and for the choice of motor the indications are given in Table 1B.

The ATEX directive states that two different certificates of conformity are to be issued. One is the "EC-Type examination certificate" for the homologation of the prototype and the other is for the "Production Quality Assurance Notification".

The certificates are issued by Certification Bodies, defined as Notified Bodies, to which the European Community assigns the task of assessing the conformity of products to community directives.

The list of notified bodies can be found in the site of the European Union on the page <http://ec.europa.eu/enterprise/ach>

The certificates of the motors can be found on Internet at <http://www.cemp.eu>, on the "Product Search" page.

IECEX certificates can also be found at <http://www.iecex.com>

All certificates may be supplied on request.

1. General informations

1.2 Common main characteristics

- Flameproof motors compliant with the Standards IEC EN 60079-0, 60079-1, 60079-7 for atmospheres where gas is present and IEC EN 60079-31 for areas where combustible dust is present.
- Three phase and single phase Squirrel Cage Asynchronous Induction motors.
- Totally enclosed, fan cooled, frame IP55 with Terminal box IP65.
- The motors dimensions comply with IEC 60072 standard.
- Power Supply 400V/50Hz. Three-phase, 1-speed motors, 2-4-6-8 poles, T4 (for sizes between 63 and 250, multi-voltage power supply 380-400-420V/50Hz and 460V/60Hz).
- Class F insulation.
- Noise level within 86 dB (A).
- Terminal Box:
 - available both in a flameproof, or increased safety version
 - large size
 - standard position - top, opposite feet
 - rotate by 90° in 4 positions.
- Motor frame and terminal box enclosure separated to avoid the transmission of explosions.
- Winding cables connected to the terminal board by means of terminal blocks or by a flameproof sealing device.
- Internal and external mechanical components painted with epoxy polyester powders;
 - stainless steel nameplate,
 - anti-corrosion screws.
- Highly resistant to impact:
 - cast iron made frame, terminal box and endshields.
 - fan cover in sheet steel.
- Low friction dust seals.
- The conformity certificates also cover alternatives, such as:
 - altitude over 1000m
 - modification of the rated voltage and rated frequency
 - power supply from an inverter
 - motor protection through temperature detectors
 - duty S1 to S9.

1.2.1 Special characteristics for motors with brakes

- Mounting options B3, B5, B35, B14, B34.
- Brake power supply:
 - 400V/3/50Hz (for motors with axle height of 63÷160)
 - 230V/1/50Hz (for motors with axle height of 180÷250)
- Double terminal board box, one for the motor and the other for the brake, both can be rotated through 90° in 4 positions, for motors with an axle height of 180÷250.

1.2.2 Special characteristics for motors for mining applications

- The motors in the ATEX series for mines come under group I Category M2. They are intended for use below ground and in surface areas of mines where firedamp or combustible powder can be found. This equipment is meant to be de-energised in an explosive atmosphere.
- Mounting options B3, B5, B35, B14, B34.
- High protection against corrosion:
 - inside and outside surfaces poly-ester powder painting (minimum thickness 150 µm)
 - stainless steel nameplate
 - anticorrosion plated fasteners.
- Highly resistant to impact:
 - special fan cover in sheet steel with rear grid protection.
- The conformity certificates also cover alternatives, such as:
 - modification of the rated voltage and rated frequency
 - power supply from an inverter
 - motor protection through temperature detectors
 - duty S1 to S9.

1.3 Main options

Electrical variants

- Non-standard voltages and frequencies (maximum voltage 1000V).
- Motors for tropical climates.
- Motors for low temperatures (-50°C)
- Temperature rise below 80K.
- Motors insulated to class H.
- Motors with bimetallic detector, thermistor PTC or thermistor PT100.
- Motors with anti-condensation heaters.
- Motors with special electrical design.
- Single-phase motors with capacitor fitted in a large-size terminal box (Ex d, max 50 µF).

Mechanical variants

- Special flanges and shafts.
- Double ended shafts.
- Cable gland fitted to terminal box.
- Terminal box with special cable entries.
- Motors without terminal box with sealing joints and conduits.
- Motors protection IP56 - IP65 - IP66.
- Motors with condensation drainage valves.

- Motors with special bearings (uni-directional, with sensors, with rollers, insulated, oversized, thrust bearings).
- Vibration level Grade A or B, according to IEC 60034-14.
- Motors with a rain cap or sun shield, water-shedding disc.
- Side terminal box frame size 160 to 315.
- Separate terminal box for auxiliary terminals.
- Low noise emission version.
- High protection against corrosion for tropical climates or applications in marine environments:
 - external mechanical components finished with epoxy paint;
 - protection of the internal parts (winding and rotor) with protective paint;
 - stainless steel screws.

Accessories

- Motors suitable for frequency inverter drive.
- Motors with encoder.
- Motors with forced ventilation (from frame size 90).

Certificates

- Motors according to American Bureau of Shipping, Bureau Veritas, Det Norske Veritas, Germanischer Lloyd, Korean Register of Shipping, Lloyd Register of Shipping, Nippon Kaiji Kyokai, R.I.Na., IECEx, CUTR, CCOE.

1.3.1 Further options for motors with brakes

Electrical variants

- Special power supply voltages and frequencies; maximum voltage 690 V both for the motors and the three-phase brake. For single-phase brakes, maximum voltage 440 V.
- Motors with anti-condensate heating coils for both the motor and the brake.
- D.C. current brake
- Positive brake (brakes when energized) with uninterrupted current.

Mechanical variants

- Manual release

1. General informations

1.4 Nomenclature

Pos. 1 = Motor series:

A	Atex	H	Motors with self-ventilating brakes
D	Motors with brakes without ventilation or with forced ventilation		

Pos. 2 = Type of application:

B	Enclosure group IIB	Q	Non sparking + Dust
C	Enclosure group IIC	N	Non sparking
D	Dust	M	Group I for mines

Pos. 3 = Type of motor (electric characteristics):

1	Single phase	4	Three-phase 2 speed quadratic torque
2	Three-phase 2 speed, constant torque	5	For lifting
3	Three-phase 1 speed	7	For inverters

Pos. 4 = Terminal box version:

0	Standard version	5	Protection method Ex e
3	Without box, with plate Ex d	2	Ex d capacitor holder in extra-size box

Pos. 5 = Size (centre height):

63	90	132	200	280
71	100	160	225	315
80	112	180	250	

Pos. 6 = Length of stator pack:

	63	71	80	90	100	112	132	160	180	200	225	250	280	315

Extra long			L									ML		L

* Three-phase, 2-speed version

Pos. 7 = Polarity:

2	2 poles	24	Double polarity: 2 / 4 poles	46	Double polarity: 4 / 6 poles
4	4 poles	28	Double polarity: 2 / 8 poles	48	Double polarity: 4 / 8 poles
6	6 poles	21	Double polarity: 2 / 12 poles	41	Double polarity: 4 / 12 poles
8	8 poles			43	Double polarity: 4 / 16 poles
10	10 poles			68	Double polarity: 6 / 8 poles
12	12 poles			61	Double polarity: 6 / 12 poles

Pos. 8 = Mounting (IM Code I):

B3	V5	V6
B5	V1	V3
B14	V18	V19
B35	V15	V36

Pos. 9 = Version with terminal box:

3F xxxD / xxxS / xx	Three-phase 1-speed; voltage for delta connection; voltage for star connection; frequency
3F xxx / xx	Three-phase, 2-speed: voltage; frequency
1F xxx / xx	Single-phase; voltage; frequency

A B 2 5 132 S 46 B5 3F 400/50 = Example of the commercial codes

2. Design features

2.1 Installation and application

Standard installation

The motors can be installed outdoors and in dusty, moist and chemically aggressive environments (industrial climate) at ambient temperatures from -20°C to 40°C.

Mechanical protection (IP); Table 2A

The mechanical protection systems for electric motors are classified with the IP code followed by two numbers and, in some applications, by a letter.

IP (International Protection):

this indicates the level of protection against accidental contacts of foreign bodies and against water.

0 - 6 (1st digit):

this indicates the level of protection against accidental contacts of foreign bodies.

0 - 8 (2nd digit):

this indicates the level of protection against water.

W, S e M (additional letters for special protections):

W; this means that the machine is to be used in specified weather conditions and with special protections.

The W letter has to be added to the IP code (e. g. IPW55).

S and M; these are used for protection against water.

The letter S stands for static protection; protection against water only for a stationary motor. Letter M stands for protection against water when the motor is running (e. g. IP56S).

Without the additional letters the protection applies in both cases (standing still and running motor).

Our standard motors are IP55 (terminal box IP65).

On request we can supply motors without ventilation with IP56 or IP57, and self ventilated motors with IP56S.

Upper-Deck Installation

Motors meant for installation on board ships and offshore areas are designed to comply with the specifications of the relevant classification authorities (see 1.3 Main options - Certificates).

Gear mounting, Oil-protected Flange

In some applications, it is necessary that the flange and the drive shaft are completely sealed against oil. This need must be specified during the order phase.

Fixed bearings

Some applications need to have a “zero axial play”. This need must be specified during the order phase.

Cooling

Motors are air-cooled by means of external surface ventilation (IC 411).

Standard motors have radial flow fan allowing fully reversible rotation. Reference standards are: IEC 60034-6. From frame size 100 to 315 motors may be supplied with forced ventilation.

Table 2A - Mechanical protection to IEC 60034-5

Protection against accidental contact and the penetration of foreign bodies	International protection	Protection against water
Complete protection against contact and approaching of voltage-carrying parts as well as against contact with rotating parts inside the housing. Protection against harmful dust deposits. The penetration of dust is not completely prevented but the dust cannot enter in such quantities as to affect operation.	IP55 standard design	A jet of water squirting out of a nozzle towards the motor from all directions has no harmful effect.
	IP56 special design	In case of temporary flood, e. g. heavy seas, water cannot enter into the motor in harmful quantities.
	IP57 special design	Motor can operate under water at given pressure.
Complete protection against contact of voltage-carrying parts as well as against contact with rotating parts inside the housing. Protection against the penetration of dust (dust-proof).	IP65 special design	A jet of water squirting out of a nozzle towards the motor from all directions has no harmful effect.
Complete protection against contact of voltage-carrying parts as well as against contact with rotating parts inside the housing. Protection against the penetration of dust (dust-proof).	IP66 special design	In case of temporary flood, e. g. heavy seas, water cannot enter into the motor in harmful quantities.

2.2 Low temperature version and anti-condensation heating

Low Temperature Version

Motors intended for use at extremely low temperatures are specially designed.

Flameproof certificates are valid for temperatures as low as -50°C.

Motors equipped with heating coils keep the minimum temperature of a stopped motor at -20°C (see table 2B).

As an alternative to heaters, the motors can be powered with low voltage via terminals U1 and V1 (see table 2B).

Also, it is possible to use a special construction with suitable materials in low temperature areas (-50°C) as an alternative to heating the motor.

A version is also available for temperature -60°C with other certifications.

Anti-condensation heating

Condensate may form inside the motor due to temperature fluctuations.

To prevent this from happening, motors

must be heated using strip type heaters on the end windings or low voltage power can be supplied to the winding via terminals U1 and V1.

The heat output is given in table 2B.

It is vital that during the motor operation the heaters are turned off.

The supply voltage for the heaters is 230V ± 10% (115V ± 10% on request)

2. Design features

Fig. 2A - Example of plate

2. Design features

2.4 Shaft ends, balancing, vibrations, noise levels, coupling and belt drives

Shaft ends

The shaft ends are cylindrical and comply with IEC 60072 in their design and in their correspondence to frame sizes and outputs. The shaft ends of all motors are equipped with a tapped hole to assist in the fitting of pulleys and couplings. The keys are always supplied along with the motors. On request, special shaft ends or a second free shaft end can be provided. Pole-changing motors with a 2-pole speed have the same shaft ends as single-speed 2-pole motors.

Balancing, and vibration

The motors are dynamically balanced with half keys in accordance with vibration grade "A" (N) normal balance IEC 60034-14 (and ISO 8821). The low-vibration version "B" (R) (reduced) can be supplied where high demands are made on quiet running. Care must be taken to ensure that transmission parts (pulleys, couplings) supplied by others are dynamically balanced with half key.

Noise level

Noise measurements are performed to IEC 60034-9. In the performance data, the sound pressure levels "Lp" are given in dB (A) for the individual frame sizes. They apply for no load at 50 Hz. The tolerance is + 3 dB (A). At 60 Hz the values of sound pressure increase approximately by 4 dB (A).

Coupling drive

When aligning a motor to be coupled directly to the machine, care must be taken that the rollers and balls of the bearings do not jam. Elastic couplings are permissible with all motors. To ensure vibration-free running and to avoid any inadmissible stress on the bearings, the machine to be coupled must still be exactly aligned in the case of elastic coupling. Maximum accuracy must be applied to the coupling of 2-pole motors.

Belt drive

Slide rails are used for motors for easy tensioning and readjustment at the belts. Permissible forces have to be taken into consideration (See Table 2). Pulleys and couplings must only be fitted and removed by means of specific tools.

Table 2E - Vibration limits according to IEC 60034-14

Balancing rate	Limit values of the speed of vibration/oscillation for frame sizes:		
	63÷132 [mm/s]	160÷280 [mm/s]	315 [mm/s]
A	1.6	2.2	2.8
B	0.7	1.1	1.8

Terms of measure: Free standing

2.5 Brake motors

Construction method

Motors in these two series are built with an integrated brake and are considered as an integral unit, consequently, a single ATEX certificate is provided for both motor and brake.

The brake is enclosed in a special enclosure built with a Ex d IIB or IIC protection type and IP65 mechanical protection.

The temperature class and maximum surface temperature are those of the motor. The electro-magnet winding is encapsulated in resin which isolates it and provides mechanical protection.

Motors with an axle height of 63 to 160 are normally fitted with a three-phase magneto with a power supply of 110V to 690V.

Alternatively, upon request, a magneto can be supplied with a direct current power supply using a rectifier, with a single-phase power supply of 48V to 440V.

If you have a direct current power supply line, the magneto can be powered directly using that line (from 24V to 230V).

Motors with an axle height of 180 to 250 use a "K10" type brake, which is only available with the magneto powered using direct current. This type of brake is always supplied with a direct current power supply using a rectifier, with a single-phase power supply of 48V to 440V.

Operation

The brake is made up of:

- the magnet;
- the counter-magnet (or mobil armature) supported by three small columns where it can slide;
- braking disk
- toothed hub secured to the motor shaft.

When the coil is powered, the magnet attracts the mobil armature which thus releases the braking disk so the motor can rotate freely.

By removing voltage to the magnet, the springs push the mobil armature against the braking disk, which, by creating friction against the motor shield, locks the shaft rotation.

In rest conditions, when the brake is not powered, the motor remains locked.

2. Design features

Braking torque calibration

The motor is supplied with a ready-to-use calibrated brake.

Special calibration available on request.

This is carried out during assembly before final testing.

Table 2F shows the standard braking torques.

Manual release

DB - DC and HB - HC series flameproof motors with brake can be supplied on request with hand release lever for the brake.

Pressure is applied on the release mechanism which moves the mobile armature, freeing the motor's shaft.

When releasing pressure on the mechanism the brake automatically returns to the fail safe position.

Variants (63÷160)

On request: brake motors can be supplied with single-phase power supply brakes between 110V and 400V. This version is only available in the Ex d version, the terminal box contains a rectifier.

- supplied with D.C. current between 24V and 260V

- positive braking-when power is applied, the brake activates and locks on. With the power supply off, the brake is not energized and the motor shaft rotates freely. The positive brake is available only with D.C. current for motors with 90÷100 axis height.

Table 2F - Standard technical data of the integrated brake

Frame size	Brake model	Static braking torque [Nm]	Air gap (+0.1 / 0) [mm]	On-off braking time requested [ms]	Number of disks [n°]	Maximum speed [1/min]	Power [VA]	Current max. [A]

2.6 Bearing system

Standard motors are equipped with radial deep groove ball bearings (ZZ pre-greased series) or open bearings complete with grease nipples.

Where requested roller, or other special bearings can be fitted.

Lubrication

The ZZ series bearings are lubricated for life and require no further lubrication.

Open bearings are supplied with grease nipples and are to be lubricated according to the indications given in the table 2G - 2H.

Bearing Seal

In order to prevent dust and water penetration, a seal ring is fitted to the endshield on the driving and non-driving ends.

These seal rings are highly resistant to vibrations, thermally stable, and resistant to mineral oils and diluted acids.

Seals for media not listed above are available on request.

2. Design features

2.7 Permissible radial loads on the shaft with standard bearings

Table 21 shows the values of radial load calculated considering:

- frequency 50Hz;
- temperature not exceeding 90°C;
- 20,000 hours of life for 2-pole motors;
- 40,000 hours of life for 4, 6, 8-pole motors.

For operation at 60Hz the values have to be reduced by 6% in order to achieve the same useful life. For double speed motors, consider always the higher speed.

The distance of the point of action of force F_R from the shoulder of the shaft must not exceed the length of the shaft end.

F_R = maximum radial load (e. g. belt load + weight of belt pulley)

$$F = \text{belt load [N]} = \frac{2 \cdot K \cdot M}{D}$$

$$M = \text{torque [Nm]} = \frac{9550 \cdot P}{n}$$

P = rated motor output [kW]

n = rated motor speed [1/min]

D = belt pulley diameter [m]

K = prestress factor governed by belt type: it is assumed approximately as follows

$K = 3$ for normal flat belts without tensioning pulley

$K = 2$ for normal flat belts with tensioning pulley

$K = 2.2$ for V-belts or special flat belts

2. Design features

2.8 Permissible axial load on the shaft with standard bearings

If the shaft end is loaded at X^2 with the permissible radial load F_A , an additional axial load is allowed (table 2L).

If the permissible radial load is not fully utilized, higher loads are possible in axial direction (Values on request).

2. Design features

2.9 Terminal box design

The standard design has four basic versions:

- Ex d IIB
- Ex d IIC
- Ex de IIB
- Ex de IIC

On request we can supply:

- additional terminal box for auxiliary terminals (Fig. 2P)
- motors without terminal box and with leads (Fig. 2Q)
- bigger terminal box with capacitor for single phase motors (Fig. 2R).

Fig. 20 - Standard motor version terminal box Ex d, group IIB

Fig. 2P

Fig. 2Q

Fig. 2R

Fig. 2S - Motor with brake terminal box

2. Design features

Fig. 2T - Motor with brake terminal box

2.10 Position of terminal box and terminals

The terminal box is usually located on top and can be turned through $4 \times 90^\circ$ (Fig. 2U).

For a horizontal mounted motor, the cable entry is normally located on the right side (looking at the driving-end).

Cable entry:

- standard position: 1
- special positions upon request: 2, 3, 4.

Fig. 2U - Positioning of the cable entry, plan view

Terminals and earthing terminal

There are a maximum number of 6 power terminals in the terminal box.

The type of monitoring device depends on

the number of possible additional terminals in the main terminal box.

PTC thermistors can be connected to two additional terminals.

Two terminals are also necessary for connecting the anticondensation heater.

For PT 100 (RTD) thermistors, 3 or 4 terminals are necessary depending on the type chosen.

An earthing terminal is located in the terminal box and another earthing terminal is located on motor frame.

2.11 Cable-entries

As standard, the motors are delivered with one or two threaded cable entries for flameproof packing glands.

Ex de motors can be also provided with Ex e packing glands.

Motors fitted with thermodetectors or heaters are always provided with additional cable entry.

3. Electrical design

3.1 Standard operating conditions

Output

The rated outputs and operating characteristics given in the performance data refer according to IEC 60034-1 to:

- continuous duty (S1)
- frequency of 50Hz
- voltage 400V (230V for single phase)
- maximum ambient temperature of 40°C
- maximum height of installation of 1000m above sea level.

Motors (IIB, Ex d or Ex nA or Ex t) can also be operated in ambient temperatures from 40°C to 80°C and at altitudes of more than 1000m to 4000m above sea level.

In these cases, the rated output given in the tables must be reduced in accordance with table 3A or a larger motor has to be chosen.

The rated data does not need to be changed, if at altitudes in excess of 1000 m above sea level, the ambient temperature is reduced according to the following table:

Altitude of installation [m]	Maximum ambient temperature [°C]
0 to 1000	40
1000 to 2000	30
2000 to 3000	19
3000 to 4000	9

Voltage, frequency

The motors as standard are built to run at the voltage and frequency with the tolerances indicated in figure 3A.

The motors can run with the variations envisaged in normal operational areas at a voltage of ± 5% and frequency of ± 2%.

Furthermore, the motors can be used in the operational area with restrictions (variations in voltage of ± 10% and frequency of ± 3%) as long as the indications given by norm 60034-1 are complied with.

Torque

The motors are fitted with squirrel-cage rotors suitable for direct-on-line starting.

The resulting starting and maximum torques, expressed as a multiple of the rated torques are given in the performance data.

A deviation in the voltage from the rated value changes the torques as an approximate function of the square of the voltages.

Normally two-speed motors have a nominal torque that is roughly the same for both speeds.

A version is also available with quadratic torque, for centrifugal machines (fans, pumps). In this case, the torque at the lower speed is roughly half that available at the higher speed.

Table 3A - Power variation of standard motors in case of coolant temperature different from 40°C or height of installation over 1000 m above sea-level

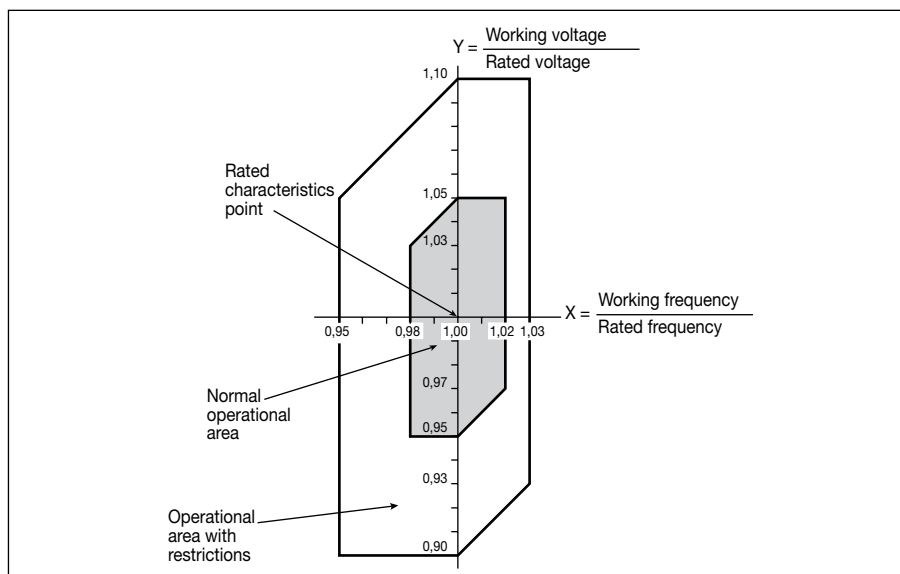

Fig. 3A

Rated current

In the performance data the rated currents are only indicated for a rated voltage of 400V.

For other voltages the rated currents are inversely proportional to the voltages:

$$\frac{U}{U'} = \frac{I'}{I}$$

This results in:

$$I' = \frac{U \cdot I}{U'}$$

Speed

The rated speeds shown in the performance data are valid for 50 Hz and the rated speed equals synchronous speed less slip.

The following speeds result from the number of poles and the mains frequencies of 50 and 60Hz:

Pole number	No-load speed at	
	50Hz [1/min]	60Hz [1/min]
2	3000	3600
4	1500	1800
6	1000	1200
8	750	900
10	600	720
12	500	600
16	375	450

Direction of rotation

The motors can be operated in both directions of rotation. If the phases are connected in the sequence L1, L2, L3 to the terminals U1, V1, W1, the motor turns clockwise.

The direction of rotation can be reversed by interchanging any two phases.

3. Electrical design

Note regarding electro-magnetic compatibility

Low voltage induction motors, if installed correctly and connected to the power supply, respect all immunity and emission limits as set out in the regulations relating to electro-magnetic compatibility (EMC “Generic Standard” for industrial environments).

In the case of supply by means of electronic impulse devices (inverters, soft starters etc.), all verifications and any modifications, necessary to ensure that emission and immunity limits, as stated within the regulations, are respected, are the responsibility of the installer.

Tolerances

According to IEC 60034-1 the electrical data stated in the tables are subject to the following tolerances:

Efficiency:

$P_n \leq 50 \text{ kW}$: - 0.15 (1- η)

$P_n > 50 \text{ kW}$: - 0.10 (1- η)

Power factor: - $\frac{1 - \cos \phi}{6}$

(minimum 0.02 - maximum 0.07)

Slip at rated load operating temperature: $\pm 20\%$ of rated slip.

Locked rotor torque (starting torque): - 15% + 25%

Maximum torque: - 10%.

Current with locked rotor: + 20% (no lower limit).

3.2 Efficiency and power factor at partial load

The efficiency and power factor values shown in the performance data refer to rated output at 50Hz.

3.3 Insulation and temperature rise

Insulation

The components of the insulation system were selected so as to ensure good protection against chemically aggressive gases, vapours, dust, oil and air humidity. All materials used for insulating the winding and winding ends correspond to insulating classes F or H according to IEC 60085:

- Enamel-insulated copper wires with temperature index 200 (class H);
- Insulating sheet on polyester base (class F);
- Impregnation with fenolic resins modified with polyesther resins (class H);

Table 3B - Limit temperature for insulating material according IEC 60085

Insulation class	Limit temperature [°C]
B	130
F	155
H	180

Temperature rise

Standard single-speed motors in continuous service (excluding 315M) have temperature rises that are within the limits for class B.

Motors with higher output and pole-changing motors normally have temperature rise within class F limit.

Table 3C - Temperature rise limit for rotating machines according IEC 60034-1

Insulation class	Max temperature rise [K]
B	80
F	105
H	125

According to Normative IEC 60034-1, the values shown in the table above may be up to 10°C higher, with a feeding current variance of $\pm 5\%$.

3. Electrical design

3.4 Duty types

In compliance with IEC 60034-1 the following duty-types are distinguished:

Duty-type S1 - continuous running duty. Constant load operation.

Duty-type S2 - short-time duty. Operating times of 10, 30, 60, and 90 minutes are recommended. After each operating period the motor remains de-energized until the winding has cooled down to the ambient temperature.

Duty-type where start-ups DO NOT INFLUENCE winding over-heating:

Duty-type S3 - intermittent periodic duty. Where starting does not influence the temperature. Duty cycle 10 minutes unless otherwise agreed upon. For the cyclic duration factor the values 15, 25, 40, and 60% are recommended.

Duty-type S6 - continuous operation periodic duty. Duty cycle 10 minutes unless otherwise

agreed upon. For the cyclic duration factor the value 15, 25, 40, and 60% are recommended.

Duty-types where starting and braking have a corresponding INFLUENCE on the temperature rise of the winding:

Duty-type S4 - intermittent periodic duty with starting. Intermittent periodical operation with identical cycles.

Duty-type S5 - intermittent periodic duty with electric braking. Intermittent periodical operation with identical cycles, which include an electrical braking phase.

For S4 and S5 duty-types the following details must be given after this code:

- Intermittence ratio;
- The number of starts per hour;
- Moment of inertia of the motor;
- Moment of inertia of the load.

Duty-type S7 - continuous operation periodic duty with electric braking.

Duty-type S8 - continuous operation periodic duty with related load/speed changes.

Duty-type S9 - duty with non-periodical load and speed variations. Typical operation for motors powered by frequency converters.

Most of the real duty-type conditions represent a combination of duty-types as mentioned under 1. and 2. In order to exactly determine a suitable motor, details of all the operating conditions are required.

N.B.:

The output ratings stated in the "Performance data" (Chapter 4.) apply to duty-type S1.

3. Electrical design

3.5 Connecting diagrams

3.5.1 Three-phase motors

Single-speed motors are normally pre-arranged to be connected in star or delta method.

Star connection

Connecting together the W2, U2, V2 terminals (star point) and connecting to the mains the U1, V1, W1 terminals a star connection is obtained.

The phase current I_{ph} and the phase voltage U_{ph} are the following:

$$I_{ph} = I_n$$

$$U_{ph} = U_n / \sqrt{3}$$

where I_n the line current and U_n is the line voltage.

Fig. 3M

Delta connection

Connecting the end of each winding to the beginning of the next winding a delta connection is obtained.

The phase current I_{ph} and the phase voltage U_{ph} are the following:

$$I_{ph} = I_n / \sqrt{3}$$

$$U_{ph} = U_n$$

Fig. 3N

Star - Delta starting

The star-delta starting is an easy way to reduce the starting current and starting torque.

Motors can be started with the star-delta starting method whenever the supply voltage correspond to the rated voltage of the motors in delta connections.

Two speed motors

Standard two speed motors are designed for only one rated voltage and for direct starting.

When the speed ratio is 1/2 the standard motors have one winding (Dahlander connection).

For other speed ratios the motors have two different windings.

Connection for single speed motors:

Number of pole: 2, 4, 6, 8

Synchronous speed at 50 Hz: 3000, 1500, 1000, 750

Two separate windings for two speed motors:

Number of pole: 2/6, 2/8, 4/6, 6/8

Synchronous speed at 50 Hz: 3000/1000, 3000/750, 1500/1000, 1000/750.

Dahlander system for two speed motors:

Number of pole: 2/4, 4/8

Synchronous speed at 50 Hz: 3000/1500, 1500/750.

Fig. 30 - Three phase motors connecting diagrams

3.5.2 Single phase motors

Single phase motors are designed for only one rated voltage.

They have two windings (starting and main winding) which have to be connected to the capacitor supplied with the motor.

The sense of rotation can be reversed according to the connecting diagram.

Fig. 3P - Single phase motors connecting diagram

3. Electrical design

3.6 Brake connection diagrams

Other connection diagrams between motor and brake are available, including a single power supply for motor and brake, or power supply on the same terminal board.

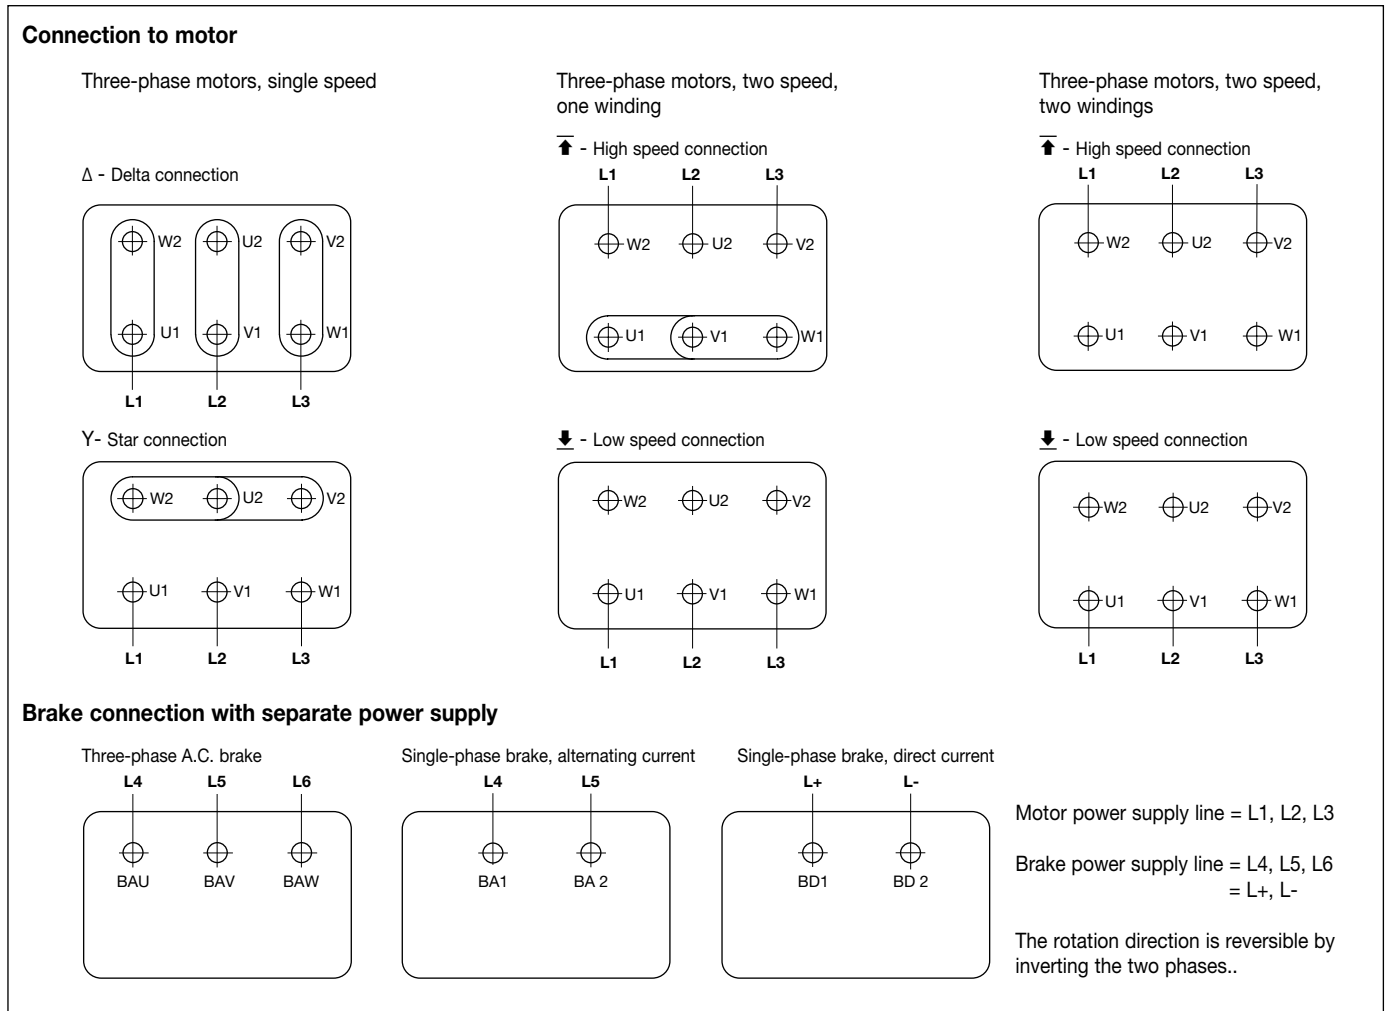

Fig. 3Q - Motor and brake connection diagrams

3.7 Hourly start-ups allowed (Braking: n° per hour)

For motors with intermittent service, (S4) the start-ups per hour allowed depend on the service time and load characteristics, of which inertia is particularly influential. In general, as inertia increases the number of start-ups reduces.

The data given in the column for the “Braking: n° per hour” in section “4. Nominal data” in this catalogue relate to operation with loads that have an inertia 1,5 times that of the motor.

3. Electrical design

3.8 Additional terminals marking (IEC60034-8)

Motors having accessories are supplied with auxiliary terminal boards which bear the marking shown in table 3E.

Table 3E

Marking	No. terminals	Additional terminal for:
TP1 - TP2 (warning)	2	Thermistor PTC (*)
TP3 - TP4 (switch off)	2	
R1 - R2 - R3 (I sensor)	3	Thermistor PT 100 with 3 wires

3.9 Protection devices

In order to protect the winding of a three-phase induction motor against thermal overloads, resulting in example from overloading and operation with only two phases, one of the following devices can be provided:

- **Bimetallic type device:**

it consists of 2 motor protectors connected in series. The contact is normally closed; the disc opens when the windings temperature reaches limits dangerous for the insulation system. On request, normally open device are available.

- **PTC temperature sensor**

(thermistors):

it consists of 3 sensors connected in series embedded in stator windings. Once it reaches the operating temperature, this device quickly changes the resistance; it must be connected to a suitable releasing device (supplied only on request).

- **PT 100 (RTD) thermometric resistors**

(from size 132 and above).

The resistance value of this device varies according to the windings temperature. They are particularly suitable for a continuous survey of the windings temperature.

For a good survey, at least two sets of PT 100 are requested; they must be connected to their proper monitoring equipment (supplied only on request).

PTC and PT 100 also offer reliable protection for operating modes other than continuous operation, e. g. short-time operation, switching operation, longtime start-up as well as for reduced cooling air flow rates and high ambient temperatures.

Motors for operation with frequency converter are always supplied with PTC thermistor temperature detectors.

Above devices have their proper terminal block located inside main box.

Upon request also available with separate terminal box.

3. Electrical design

3.10 Frequency converter driven motors

Motors with enclosures in protection type “d”, “de” are designed for variable speed drives.

Chapter 4.7 lists the electrical data in different working conditions of the Ex d, Ex de motors shown in this catalogue.

Specific type-approvals are needed for motors with protection type Ex e, while in many countries motors with protection type Ex nA are strongly restricted.

When using a squirrel cage “Ex d” motor with a frequency converter, the following points must be taken into account in addition to the general selection criteria:

- The voltage (or current) fed by the frequency converter is not purely sinusoidal.

As a result it may increase the losses, vibration, and noise of the motor. Furthermore, a change in the distribution of the losses may affect the motor temperature balance.

In every case, the motor must be correctly sized according to the instructions supplied with the selected frequency converter and with our technical data.

- In a frequency converter drive the actual operating speed of the motor may deviate considerably from its rated speed.

For higher speeds it must be ensured that the highest permissible speed of rotation of the motor, or the critical speed of the entire equipment, is not exceeded.

In addition, bearing lubrication and any ventilation noise suppression arrangements will require special attention.

- The torque values shown in this catalogue for motors with constant torque at frequencies over 60Hz can be stably supplied only if the motor has a delta connection.

For example, to stably achieve these values from a 230/400V 50Hz winding motor with a 400V 50Hz mains voltage supply, the motor must have a delta connection and, consequently, the inverter must be configured so that at 50Hz it supplies a voltage of 230V.

Vice-versa, with a star connection, the values listed can be supplied only for very short periods.

- Operating periods at a speed above 3600 1/min must never exceed 10% of the entire work cycle of the motor to ensure the bearings last accordingly.

- If the rated voltage is 500V or if there is a long feeding cable between the motor and the frequency converter, the insulation of the motor must be reinforced because of the occurring voltage peaks.

A correct earthing of the motor and the driven equipment is also important to avoid bearing currents and voltages.

The features of motors for use in constant torque and those for use in quadratic torque are indicated in section 4.7.

Section 7.1 and 7.2 contains graphs showing loading curves for the use of variable torque motors.

The reference torque value (M_n) is the value indicated in the tables in section 4.1.

4. Dati nominali

- 4.1 **Motori trifase, 1 velocità**, dati nominali a 400V 50Hz avviamento diretto
- 4.2 **Motori trifase, 1 velocità IE2**, dati nominali a 400V 50Hz avviamento diretto
- 4.3 **Motori trifase, 2 velocità**, dati nominali a 400V 50Hz avviamento diretto, per uso generale (coppia costante)
- 4.4 **Motori trifase, 2 velocità**, dati nominali a 400V 50Hz avviamento diretto, per macchine centrifughe (coppia quadratica)
- 4.5 **Motori monofase, 1 velocità**, dati nominali a 230V 50Hz avviamento diretto
- 4.6 **Motori trifase con freno, 1 o 2 velocità**, per sollevamento, dati nominali a 400V 50Hz avviamento diretto
- 4.7 **Motori alimentati da inverter**

4. Performance data

- 4.1 *Three-phase motors, 1 speed, rated data at 400V 50Hz direct on line start*
- 4.2 *Three-phase motors, 1 speed IE2 rated data at 400V 50Hz direct on line start*
- 4.3 *Three-phase motors, 2 speeds, rated data at 400V 50Hz direct on line start, for general purpose (constant torque)*
- 4.4 *Three-phase motors, 2 speeds, rated data at 400V 50Hz direct on line start, for centrifugal machines (quadratic torque)*
- 4.5 *Single-phase motors, 1 speed, rated data at 230V 50Hz direct on line start*
- 4.6 *Three-phase motors with brake, 1 or 2 speeds, for hoist applications, rated data at 400V 50Hz direct on line start*
- 4.7 *Motors energized by inverter*

4. Données nominales

- 4.1 **Moteurs triphasés, 1 vitesse**, données nominales à 400V 50Hz démarrage direct
- 4.2 **Moteurs triphasés, 1 vitesse IE2**, données nominales à 400V 50Hz démarrage direct
- 4.3 **Moteurs triphasés, 2 vitesses**, données nominales à 400V 50Hz démarrage direct, pour usage général (couple constant)
- 4.4 **Moteurs triphasés, 2 vitesses**, données nominales à 400V 50Hz démarrage direct, pour machines centrifuges (couple quadratique)
- 4.5 **Moteurs monophasés, 1 vitesse**, données nominales à 230V 50Hz démarrage direct
- 4.6 **Moteurs triphasés avec frein, 1 ou 2 vitesses**, pour levage, données nominales à 400 V 50Hz démarrage direct
- 4.7 **Moteurs alimentés par variateur**

4. Betriebsdaten

- 4.1 *Drehstrom Motoren, 1 Drehzahl, Betriebsdaten bei 400V 50Hz Direkteinschaltung*
- 4.2 *Drehstrom Motoren, 1 Drehzahl IE2, Betriebsdaten bei 400V 50Hz Direkteinschaltung*
- 4.3 *Drehstrom Motoren, 2 Drehzahlen, Betriebsdaten bei 400V 50Hz Direkteinschaltung, für allgemeinen Gebrauch (konstantes Gegenmoment)*
- 4.4 *Drehstrom Motoren, 2 Drehzahlen, Betriebsdaten bei 400V 50Hz Direkteinschaltung, für Zentrifugalmaschinen (quadratisches Gegenmoment)*
- 4.5 *Einphasen Motoren, 1 Drehzahl, Betriebsdaten bei 230V 50Hz Direkteinschaltung*
- 4.6 *Drehstrom Motoren mit Bremse, 1 oder 2 Drehzahlen, Hubmotoren, Betriebsdaten bei 400V 50Hz Direkteinschaltung*
- 4.7 *Motoren mit Umrichterversorgung*

4. Datos nominales

- 4.1 **Motores trifásicos, 1 velocidad**, datos nominales 400V 50Hz arranque directo
- 4.2 **Motores trifásicos, 1 velocidad IE2**, datos nominales 400V 50Hz arranque directo
- 4.3 **Motores trifásicos, 2 velocidades**, datos nominales 400V 50Hz arranque directo, para uso general (par constante)
- 4.4 **Motores trifásicos, 2 velocidades**, datos nominales 400V 50Hz arranque directo, para máquinas centrifugas (par cuadrático)
- 4.5 **Motores monofásicos, 1 velocidad**, datos nominales 230V 50Hz arranque directo
- 4.6 **Motores trifásicos con freno, 1 o 2 velocidades**, para elevación, datos nominales 400V 50Hz arranque directo
- 4.7 **Motores alimentados con inverter**

◆ Si consiglia IC 416 per ridurre il rumore (disponibile da altezza d'asse 100)
To reduce noise level, IC 416 is advisable (available from frame size 100)
On conseille IC 416 pour réduire le bruit (disponible à partir de hauteur d'axe 100)
Zur Lärmverringerng wird IC 416 empfohlen (verfügbar ab Baugröße 100)
Se aconseja IC 416 para reducir el nivel de ruido (disponible a partir de altura del eje 100)

★ Frequenza superiore su richiesta
Higher frequency upon request
Fréquence supérieure sur demande
Auf Anfrage höhere Frequenz
Frecuencia mayor a petición del cliente

Moment	Frequenz	Eigenbelüftet	Fremdbelüftung (verfügbar ab Baugröße 100)
Par	Frecuencia	Autoventilados	Ventilacion asistida (disponible a partir de altura del eje 100)

2 poli - pole - pôles - polig - polos

Note:

Nel funzionamento a coppia costante il valore di coppia utilizzabile è il valore minore del range di funzionamento prescelto

In the constant torque operating mode, the usable torque value is the lowest value of the chosen range of operation

Lors du fonctionnement à couple constant la valeur de couple utilisable est la valeur inférieure à la plage de fonctionnement sélectionnée

Im Betrieb mit konstantem Drehmoment ist der verwendbare Momentwert der Mindestwert des gewählten Betriebsbereichs

En el funcionamiento con par constante el valor de par que se puede utilizar es el valor menor del intervalo de funcionamiento elegido

Il valore di coppia di riferimento (Mn) è quello indicato nelle tabelle della sezione 4.1

The reference torque value (Mn) is the value indicated in the tables in section 4.1

La valeur de couple de référence (Mn) est celle indiquée dans les tableaux de la section 4.1

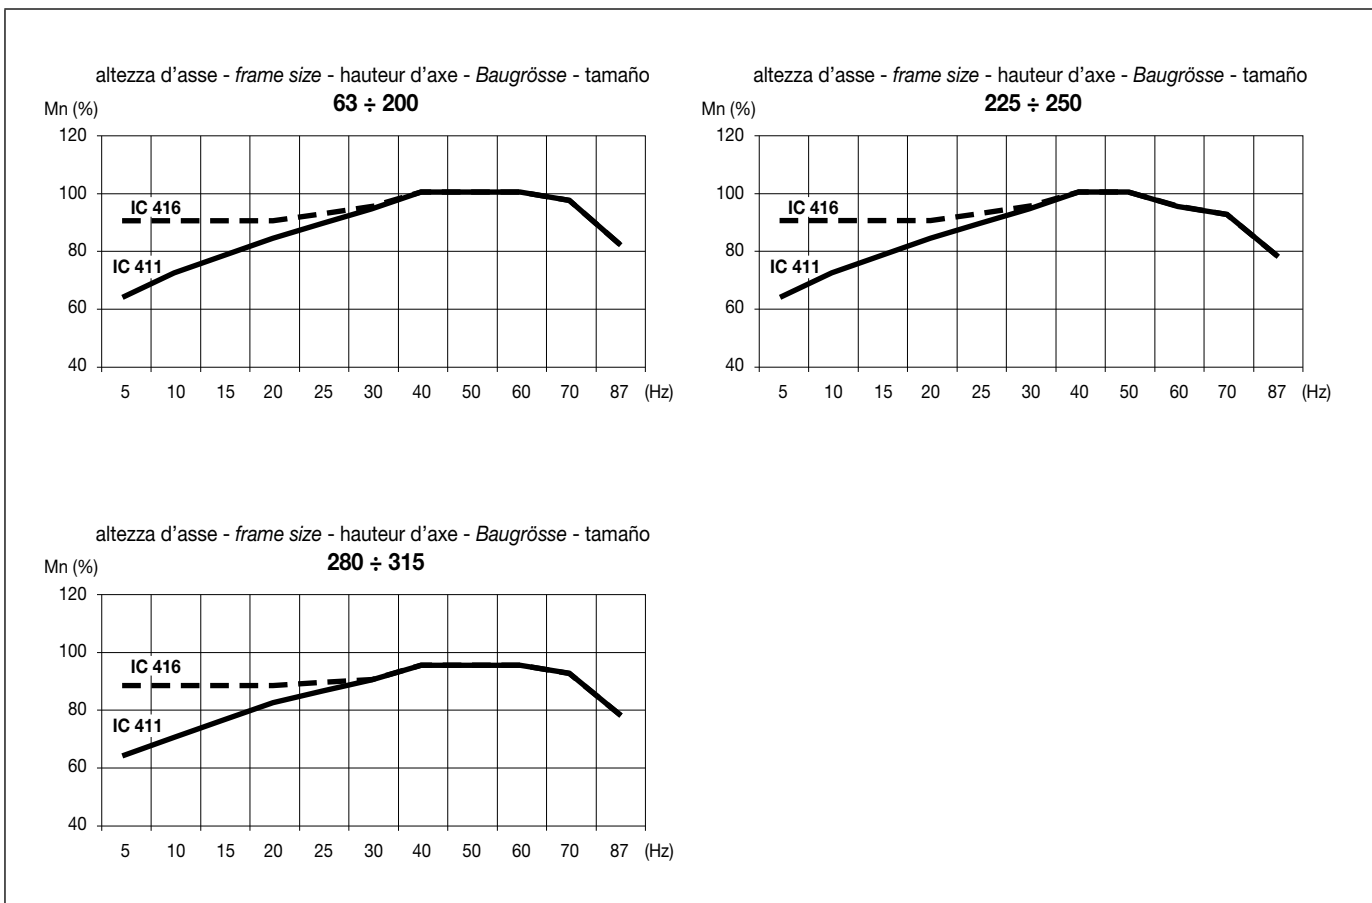

Der Richtwert des Drehmoments (Mn) ist der in den Tabellen in Abschnitt 4.1 angegebene

El valor de par de referencia (Mn) es el que recogen las tablas de la sección 4.1

ITALIANO	Motori alimentati da inverter - Curve di caricabilità	Coppia variabile flusso indebolito
ENGLISH	Motors energized by inverter - Load capacity curves	Variable torque - Weakened flux
FRANÇAIS	Moteurs alimentés par variateur - Courbes de chargeabilité	Couple variable flux affaibli
DEUTSCH	Motoren mit Umrichterversorgung - Belastungskurven	Variables Drehmoment mit Feldschwächbetrieb
ESPAÑOL	Motores alimentados con inverter - Curvas de capacidad de carga	Par variable flujo debilitado

- 5.3** Dimensiones totales de los motores con freno

ITALIANO	Forme costruttive
ENGLISH	Mounting arrangements
FRANÇAIS	Formes de construction
DEUTSCH	5. Bauformen
ESPAÑOL	5.1 Formas de fabricación

Le forme costruttive comunemente utilizzate sono raffigurate nella tabella 5A. Su richiesta sono fornite altre forme costruttive.

I motori ordinati nelle forme costruttive IM B3, IM B5 o IM B14 possono essere utilizzati anche per altre posizioni di montaggio:

- IM B3 in IM B6, IM B7, IM B8, IM V5 o IM V6,
- IM B5 in IM V1 o IM V3,
- IM B14 in IM V18 o IM V19.

La normativa per le macchine elettriche a sicurezza prescrive che debba essere impedita la caduta di corpi estranei all'interno del coprimentola.

A tale scopo i motori montati in verticale con albero rivolto verso il basso devono avere un tettuccio di protezione sopra il coprimentola.

The most commonly used mounting arrangements are shown in the table 5A. Other mounting arrangements are available on request.

Standard motors ordered in basic mounting arrangements (universal mounting arrangements)

IM B3, IM B5 or IM B14 can also be operated in the following different mounting positions:

- *IM B3 in IM B6, IM B7, IM B8, IM V5 or IM V6,*
- *IM B5 in IM V1 or IM V3,*
- *IM B14 in IM V18 or IM V19.*

According to the safety standard for electrical machines, foreign objects must be prevented from falling into the fan cover.

Motors for vertical arrangement with shaft end down are fitted with a protective hood over the fan cowl.

Les formes de construction communément utilisées sont représentées au tableau 5A. Sur demande, d'autres formes de construction peuvent être fournies.

Les moteurs commandés avec les formes de construction IM B3, IM B5 ou IM B14 peuvent également être utilisés dans d'autres positions de montage:

- IM B3 en IM B6, IM B7, IM B8, IM V5 ou IM V6,
- IM B5 en IM V1 ou IM V3,
- IM B14 en IM V18 ou IM V19.

La norme pour les machines électriques à sécurité indique qu'il faut empêcher les corps étrangers de tomber à l'intérieur du carter du ventilateur.

A cette fin, les moteurs installés verticalement avec l'arbre orienté vers le bas doivent être munis d'une tôle de protection placée au-dessus du protégé-ventilateur.

Die gewöhnlich verwendeten Bauformen werden in der Tabelle 5A dargestellt. Auf Wunsch können auch andere Bauformen geliefert werden.

Die mit den Bauformen IM B3, IM B5 oder IM B14 bestellten Motoren können auch für andere Montagepositionen verwendet werden:

- *IM B3 als IM B6, IM B7, IM B8, IM V5 oder IM V6,*
- *IM B5 als IM V1 oder IM V3,*
- *IM B14 als IM V18 oder IM V19.*

Die Richtlinie für die elektrischen Maschinen zur Sicherheit schreibt vor, dass das Herabfallen von Fremdkörpern in das Innere der Lüfterhaube geschützt sein muss.

Um dies zu verhindern, sind vertikale Motoren, deren Welle nach unten gerichtet ist, mit einem Schutzdach über der Lüfterhaube ausgestattet.

Las formas constructivas utilizadas corrientemente están descritas en la tabla 5A. Sobre pedido se proporcionan otras formas constructivas.

Los motores requeridos en las formas constructivas IM B3, IM B5 o IM B14 pueden ser utilizados incluso para otras posiciones de montaje:

- IM B3 in IM B6, IM B7, IM B8, IM V5 o IM V6,
- IM B5 in IM V1 o IM V3,
- IM B14 in IM V1 o IM V3,

La normativa sobre las máquinas eléctricas de seguridad prescribe que se debe impedir la caída de cuerpos extraños en el interior de la cubierta del ventilador.

Con este fin los motores instalados en vertical con el eje hacia abajo tiene que tener una tapa de protección por encima del cubre ventilador.

parapioggia: normalmente presente solo nei motori autoventilati (IC411) per montaggio verticale, albero in basso
rain cover: normally found only on self-ventilating motors (IC411) for vertical assembly, shaft at the bottom
capot parapluie: normalement, elle n'est présente que sur les moteurs autoventilés (IC411) destinés à un montage vertical, arbre en bas
Regenschutz: ist normalerweise nur bei den eigenbelüfteten Motoren (IC411) für die senkrechte Montage, Welle unten, vorhanden
tapa de protección contra la lluvia: normalmente sólo está presente en los motores autoventilados (IC411) para el montaje en vertical, con el eje en la parte inferior

Nel redigere questa documentazione è stata posta ogni cura al fine di assicurare la correttezza delle informazioni contenute.

Every care has been taken to ensure the accuracy of the information contained in this publication.

Dans la préparation de cette documentation nous avons pris le soin d'y intégrer les informations les plus exactes possibles.

Die Ausführungen und technischen Eigenschaften, die in dieser Broschüre angegeben sind, dürfen nicht als verbindlich angesehen werden.

La presente documentación se ha redactado de manera muy atenta para poder asegurar que las informaciones que contiene son correctas.

Tuttavia, anche in conseguenza della politica di continuo sviluppo e miglioramento della qualità del prodotto perseguita da Cemp, la società si riserva il diritto e la facoltà di apportare modifiche di qualsiasi genere, in qualsiasi momento e senza preavviso, sia a questo documento sia ai propri prodotti.

Due to Cemp's policy of continuous development and improvement, the company reserves the right to supply products which may differ slightly from those illustrated and described in this publication.

Néanmoins, compte tenu de notre politique de développement et d'amélioration continue des produits, la Société Cemp se réserve le droit et la faculté d'apporter toute modification sur la documentation et sur les produits, à tout moment et sans préavis.

In keinem Fall können jedoch die in diesem Dokument aufgeführten technischen Daten als rechtlich verbindlich angesehen werden.

No obstante, como consecuencia de la política de continuo desarrollo y mejora de la calidad del producto que Cemp pone en práctica, la sociedad se reserva el derecho y la facultad de modificar en lo que fuera necesario, en cualquier momento y sin que para ello medie preaviso alguno, tanto este documento como sus productos.

Le descrizioni e le caratteristiche tecniche della presente pubblicazione non sono quindi impegnative e i dati riportati non costituiscono, in nessun caso, impegno contrattuale.

Descriptions and technical features listed in this brochure may not be considered as binding. Under no circumstances should data in this publication be considered as a contractual obligation.

Les descriptifs et les caractéristiques techniques contenus dans ce catalogue n'engagent pas la Société. Par conséquent, ces données ne constituent en aucun cas un engagement contractuel.

Cemp behält sich das Recht vor, ohne Mitteilung, jegliche Abweichungen und Änderungen jederzeit vorzunehmen, sowohl in diesem Dokument als auch bei den Produkten, die hier beschrieben sind.

Por lo tanto, las descripciones y las características técnicas indicadas en el presente documento no son vinculantes, y los datos que contiene no constituyen en ningún caso, vínculo contractual.
